

Given a grid having 7 columns. 4 players will start their journey in that grid. Initially all of them are in first row. A player can move diagonally to the next row. For example, a player is in row 3 and column 4, which can also be represented as (3,4), this player has only two valid moves, (4,3) and (4,5). But if the player is in (3, 1), he has only one valid move, which is (4,2). In their journey, any cell of the grid can not be visited more than once by a player.

In this problem you have to find, in how many ways all of the players can reach to row  $N$ .

## Input

The first line of input is an integer  $T$  ( $T < 100$ ) that indicates the number of test cases. Each case starts with a line containing only 1 integer  $N$  ( $1 \leq N \leq 1000000000$ ), followed by a line having 7 integers ( $r_1$  to  $r_7$ ), which will represent the state of first row.  $r_i = 0$  represents that, there is no player in row  $i$ , otherwise  $r_i$  will represent the player number. Player numbers will be between 1 to 4.

## Output

For each case, output the number of ways to reach row  $N$ . You have to give your output modulo 1000000007.

## Sample Input

```
3
1
1 0 2 0 3 0 4
2
1 0 2 0 3 0 4
2
1 2 3 4 0 0 0
```

## Sample Output

```
1
0
3
```
